

## Vaccinated Vs. Unvaccinated

Vaccine Studies

Martin G. Collins

Given 12-May-18; Sermon #1432c

Sadly, vaccine propaganda has become so ingrained in our society that the very notion of even questioning vaccine safety is seen as an outrageous act of total insanity. Certainly, those who dare to even suggest that vaccines contain harmful ingredients are labeled as “foolish,” “conspiracy nuts” and out of touch with “real” science. Anyone who suggests that vaccines have the potential to harm children is labeled “anti-science.”

Actually, the belief that vaccines are completely innocuous is what is “anti-science,” because it disregards the overwhelming evidence that vaccines can and do harm children every day. For example, those with the highest rates of autism also have the highest rates of vaccination.

So, let’s answer the common-sense question: Are health outcomes different between vaccinated children and *unvaccinated* children?

People really only read the ingredients on food and personal care products, but as a society, we naively rely on medical doctors to warn us that flu shots contain high levels of mercury—yes, they do still contain mercury, even though we have been told they do not—listed as thimerosal, plus formaldehyde (for embalming dead people) and aluminum (the leading cause of Alzheimer’s).

The CDC blatantly lies to Americans every year, saying that mercury has been removed from childhood vaccines, but the influenza vaccine (nicknamed the flu shot for good reason) is literally laced and loaded with mercury, some shots containing up to 25,000 times the amount the EPA says is too much to consume from tap water or fish.

Imagine that. Not only would we be severely overdosing ourselves or our child with a known neurotoxin and brain-damaging chemical, but with a vaccine we are bypassing the normal bodily defense systems and filters, including the skin, the lungs and the digestive tract. Flu vaccines are shot directly into muscle tissue, entering the blood and sometimes crossing the blood/brain barrier.

Every three months, the National Vaccine Injury Compensation Program (NVICP) updates its data on the alarming statistics of humans suffering the dire health consequences of injecting organomercury, formaldehyde and aluminum into their muscle tissue. The vast majority of vaccine injury cases settled—including for several

deaths—are for the flu shot.

Now let's look at some vaccine studies. Hang on to your hats, because I am going to give you a hurricane of statistics.

In 2017, Dr. Anthony Mawson published the results of a parent survey titled, "Studies Comparing Vaccinated to Unvaccinated Populations." He compared the health outcomes of 261 unvaccinated children with 405 partially or fully vaccinated children. Mawson's findings were shared with Vermont lawmakers on January 18, 2018. They are consistent with what we hear often from parents and other studies.

Dr. Mawson's analysis of parent data reveal that:

- » The odds of ear infection were almost four-fold higher among their vaccinated children
- » The odds of pneumonia were significantly higher among their vaccinated children

The vaccinated children were also significantly more likely than the unvaccinated children to have been diagnosed with the following:

- » The vaccinated children had 26 times more allergic rhinitis (e.g., sinus inflammation; dust, mold and pollen allergies) than the unvaccinated.
- » The vaccinated children had 3 times more other allergies than the unvaccinated.
- » The vaccinated children had 3 times more eczema/atopic dermatitis than the unvaccinated.
- » The vaccinated children had 5 times more learning disabilities than the unvaccinated.
- » The vaccinated children had 5 times more ADHD than the unvaccinated.
- » The vaccinated children had 5 times more autism spectrum disorder than the unvaccinated.
- » The vaccinated children were also more likely to have increased

Vaccinated vs. Unvaccinated by Martin G. Collins (<http://www.cgg.org>)

healthcare utilization: to have had ear tubes placed; to have used antibiotics; to have used allergy and fever medications; to have visited a doctor for a health issue in the previous year, and to have been hospitalized.

Another study: The 2011 Salzburger Study involved 1004 unvaccinated children. It showed the following results —

0% had asthma, compared with (8-12% of the vaccinated)

1.2% had atopic dermatitis, compared with (10-20% of the vaccinated)

3% had allergies, compared with (25% of the vaccinated)

0.79% had ADHD, compared with (5-10% of the vaccinated)

Another study: The 2000 Long-term Study in Guinea-Bissau observed and studied routine vaccinations and child survival of the children of 15,000 mothers for 5 years from 1990 to 1996. It revealed the following result: The death rate in vaccinated children against diphtheria, tetanus and whooping cough is twice as high as the unvaccinated children.

Another study: The 1992 New Zealand Immunization Awareness Study involved 254 children, in which 133 children were vaccinated and 121 remained unvaccinated. It revealed the following results:

- » The vaccinated children had 5 times more asthma than the unvaccinated.
- » The vaccinated children had 10 times more hyperactivity than the unvaccinated.

According to the CDC, from 2006 to 2015 over 2.8 billion doses of covered vaccines were distributed in the U.S.

In 2016, 22,000 nurses refused mandatory vaccinations because they did not want to be forced to take a concoction with numerous questionable ingredients, including known neurotoxins like aluminum and foreign proteins derived from genetically modified

ingredients.

There are many peer-reviewed medical studies, government statistics, and other credible information that collectively raise legitimate questions about current immunization policy. These concerns are being echoed by a growing number of doctors, medical researchers, and professional organizations who are speaking out about problems with mandatory immunizations.

What is happening in the nation? California, in 2015, passed a law saying that vaccinations are mandatory, and that not even religious or personal objections will be accepted, and that could spread even more across the nation from state to state, because that is what they intend to have done everywhere. They even tried to put it in Obamacare, but there was too much resistance.

You will have to decide for yourself whether you and your children should avoid vaccines. I encourage you to thoroughly research this subject before receiving such things. The quality of your life and the lives of your children depend on it. Children belong to God, not to the state. God entrusts them to the parents He chooses, not to human governments. God's word makes it clear: Parents are to care for and protect the children placed in their trust.
